\* p<0.10, \*\* p<0.05, \*\*\* p<0.01. Each column presents the OLS estimate on the variable for 'assigned a loan' for the various sub-samples (e.g. all 'female'). Huber-White standard errors in parentheses. The mean of the dependent variable for the control group for the various sub-samples is reported in brackets. The number of observations in each sub-sample is listed below the mean. All regressions include controls for the probability of assignment to treatment, survey month, survey year, application month, and application year. All sample restrictions based on application data. Lower randomization window corresponds to a 60% probability of assignment to treatment. Higher randomization window corresponds to 85% probability of assignment to treatment. To determine profits, we asked: "What was the total income each business earned during the past month after paying all expenses including wages of employees, but not including any income or goods paid to yourself? In other words, what were the profits of each business during the past month?"
